

Eye chip removal – BL, SBL, RBL, FBL Blythes

1. After removing the eyeballs soak them in HOT (not boiling), soapy water for 15-30 mins. Refresh the hot water and soak for an additional 5 minutes. Attach a strip of exterior-grade foam mounting tape to your smooth countertop (glass, ceramic tile, natural stone). Quickly dry off the warm eyeball and press one chip firmly into the tape. Hold for 5 seconds and quickly pull straight up. The chip should be left behind on the tape strip. If not, try another chip or return the eyeball to the hot water to soak longer.

2. If you have trouble finding foam double stick tape, you can also use a hot-glue stick. Soak the eyeballs as described above. Dry off one eyeball. Melt the end of a hot glue stick with a lighter (use caution when handling open flame!) and press onto one eye chip.

3. Let cool for a minute

4. Pull straight out with glue stick. If the chip does not yet pop out, soak again in hot water and repeat.
