

Eye chip removal – EBL Blythes

1. After removing the eyeballs soak them in a glass of warm, soapy water for 15-30 mins. Using a thin, blunt rod (small paintbrush handle, crochet hook, etc) push the chips out from the inside through the opening at the ends of the eyeball. The glue should be soft enough that you dont have to push hard and gouge the pupil. If not, soak them in warmer water. Once you get one chip out, you will have a much larger hole to work through. One eyeball has a very small hole - you may find it easier to pull the first chip out by following the foam-tape method mentioned in SBL eyechip removal. While the glue is still wet, use a cotton swab to clean it out of the eyechip sockets. Rinse and dry both eyeballs thoroughly.
